

# PUCINI

corrected grain

Puccini is a high quality hard wearing corrected grain leather made in Italy. With a high cutting yield and soft touch, these ranges are perfect for high traffic areas for both commercial and residential projects as well as internal marine applications. Puccini is produced on clean Italian hides at around 4.0 - 4.5sqm

**TECHNICAL SPECIFICATIONS:**

Horizontal burn test, wall + elevator	AS/NZS 3837
Soft furnishings burn test	AS.1530.30
Internal marine	IMO 652

Type	Corrected Grain
Size	4.0 - 4.5sqm approx.
Thickness	0.9 - 1.1mm
Country of origin	Italy
Application	Commercial, Residential + Internal Marine

**CARE INSTRUCTIONS:**

Protect from direct sunlight, excessive heat and sharp objects. Clean with a damp cloth and Ph neutral cleaner. Do not soak leather with excessive water. Take regular care of your leather by removing any dust with either a soft brushed vacuum cleaner or damp cloth. Avoid chemical polishes and soap. Polish with a dry cloth.

corrected grain

Matador is a high quality hard wearing corrected grain leather made in Italy. With a high cutting yield and soft touch, these ranges are perfect for high traffic areas for both commercial and residential projects as well as internal marine applications. Matador is our South American equivalent. Being on South American raw material, there will be a hump hole present along with brand marks due to the breed of bovine. These are larger hides of around 4.5 / 5.5sqm.

## Group Number Assessment

(In accordance with AS 5637.1-2015)

This is to confirm that the product as described below has been tested by AWTA Product Testing .

Testing was performed in accordance with AS/NZS 3837-1998 Method of test for heat and smoke release rates for materials and products using an oxygen consumption calorimeter.

Additional Observations

Difficulties Encountered during Testing

These test results relate only to the behaviour of the product under the conditions of the test, they are not intended to be the sole criterion for assessment of performance under real fire conditions.

The results of these fire tests may be used to directly assess fire hazard, but it should be recognised that a single test method will not provide a full assessment of the fire hazard under all fire conditions.

Samples were loose laid onto a substrate of 6mm thick cement sheeting prior to testing.

Tests were conducted with a wire grid placed over the sample during testing .

This was done to contain intumescent sample within the sample holder.

Each test specimen had an unattached backing of 4.5mm thick fibre reinforced cement board.

Each test specimen was restrained on the exposed face by a layer of galvanised welded square mesh made from wire of nominal diameter 0.8mm and nominal spacing 12mm in both directions and securely fixed to a backing board at four points each 100mm from the centre of the sample and the assembly clamped in four places.

To allow free movement of sample during testing all corners were folded away from the clamps.

These results only apply to the specimen mounted, as described in this report. The result of this fire test may be used to directly assess fire hazard, but it should be recognised that a single test method will not provide a full assessment of fire hazard under all fire conditions.

The reaction of thin unsupported flexible materials to flame impingement can be assessed in accordance with AS 1530.2. Where materials of thickness less than 2mm that are sufficiently flexible to be bent by hand around a mandrel of 2mm diameter or less are subjected to the test described herein, they should also be subjected to the test in AS 1530.2.
